

ASSIGNMENT 3- A simple RESTFUL API using React.js, DataBase Creation, and Creating Index

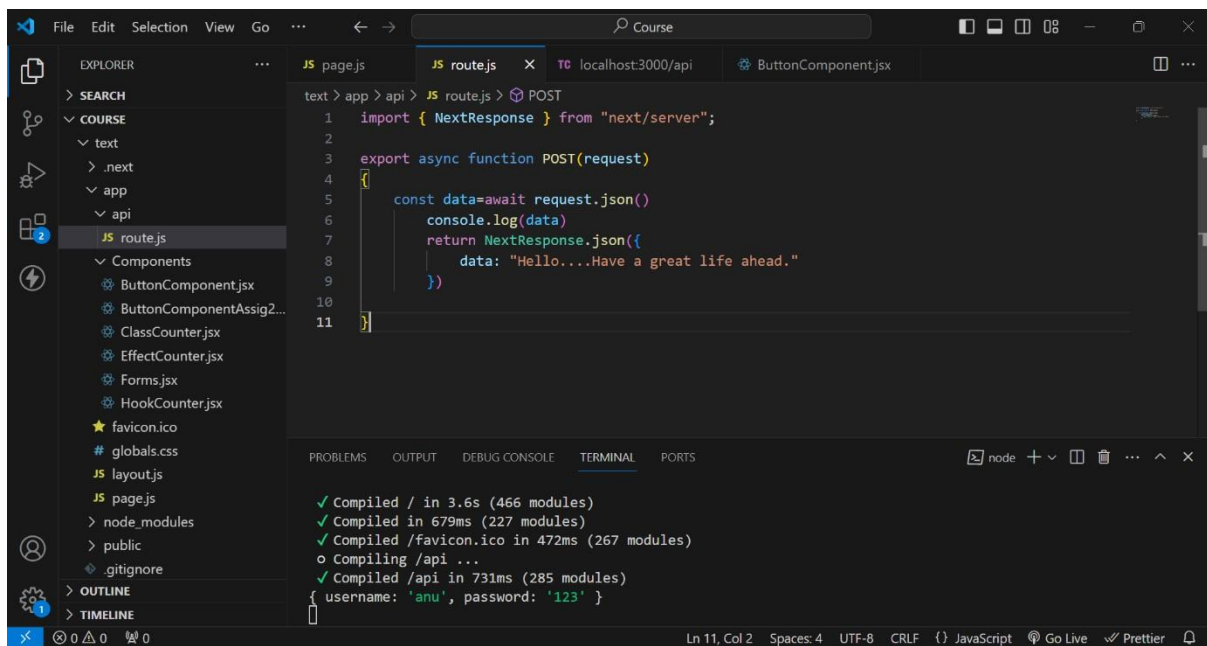

Name : BOLLA YASWINI

Roll no : 20NN1A1205

E-Mail : yaswinibolla520@gmail.com

College : Vignan's Nirua Institute of Science and Techonolgy for Womens

Rest API code

The screenshot shows the Visual Studio Code editor with a project structure on the left. The file explorer shows a directory named 'api' containing a 'route.js' file. The main editor displays the content of 'route.js', which defines a POST endpoint. The terminal at the bottom shows the output of running the application, indicating successful compilation and execution of the API endpoint.

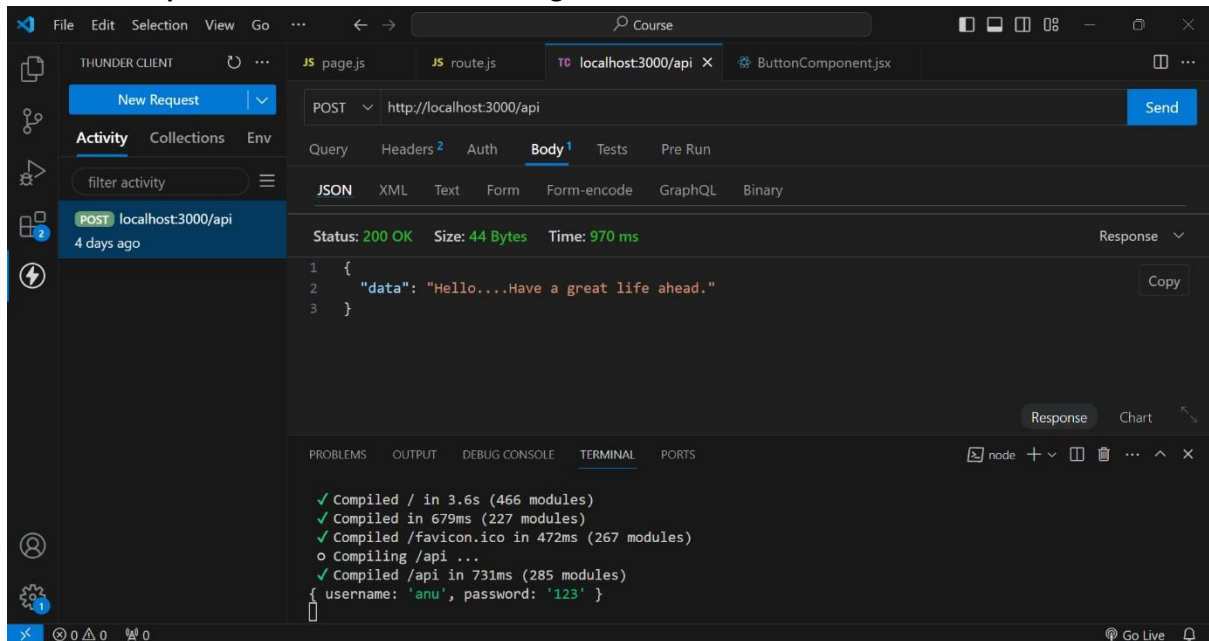

```
1 import { NextResponse } from "next/server";
2
3 export async function POST(request)
4 {
5     const data=await request.json()
6     console.log(data)
7     return NextResponse.json({
8         data: "Hello....Have a great life ahead."
9     })
10 }
11 }
```

Terminal Output:

```
✓ Compiled / in 3.6s (466 modules)
✓ Compiled in 679ms (227 modules)
✓ Compiled /favicon.ico in 472ms (267 modules)
o Compiling /api ...
✓ Compiled /api in 731ms (285 modules)
{ username: 'anu', password: '123' }
```

Rest Output on Thunder Client

This is the output when we create an API using REST.

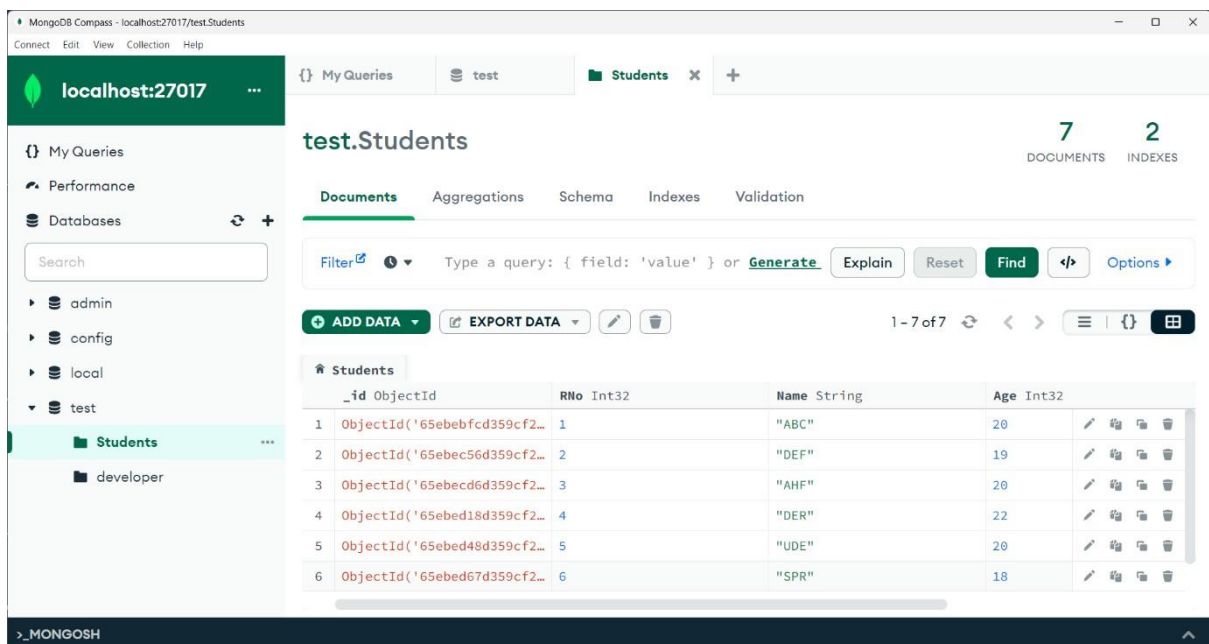

DataBase Creation

1st we created a database named test

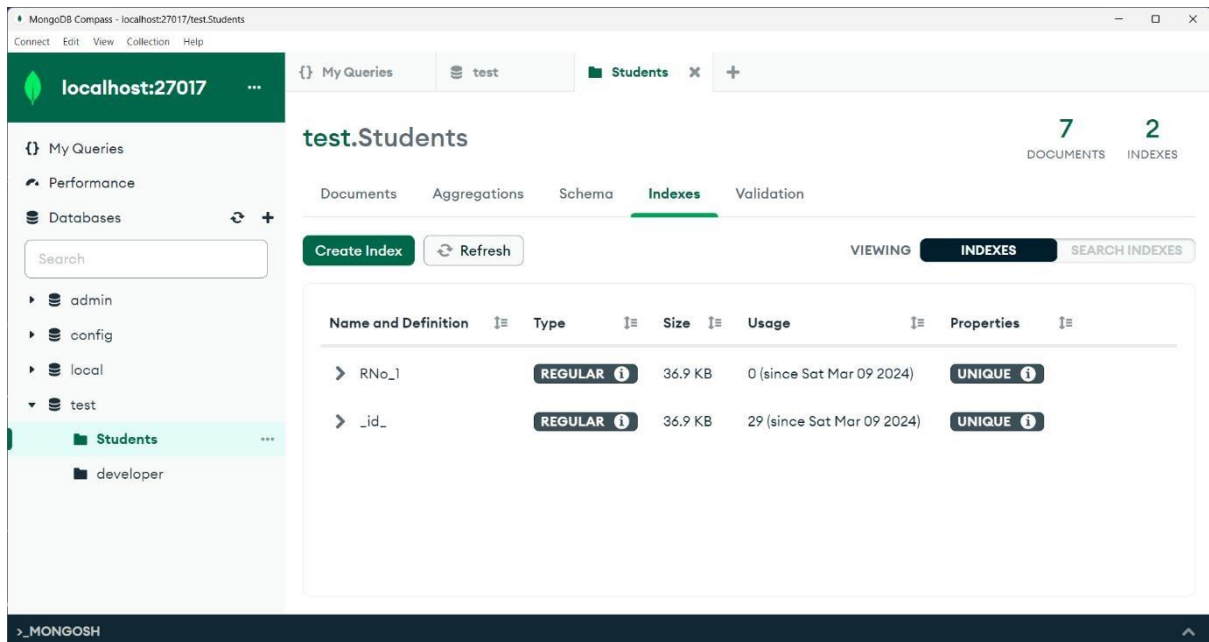

In that test we created a collection named Students

And finally by using ADD DATA , we added data of the students like rno, name, age.

Indexing Creation

As rno is the unique attribute through which we identify a student uniquely. So, here I created an index based on Rno. And assigned unique key to it.

Indexing usage

As we gave Rno as unique, If we try to insert a duplicate document that is existed it shows an error like..duplicate collection.
